THE GREAT PYRAMID INVESTIGATION

Giza Plateau, Egypt. 29.9792 N, 31.1342 E

CASE NO.:	HE-114-GP
FILE OPENED:	1837
STATUS:	UNRESOLVED - ACTIVE
DISTRIBUTION:	PURCHASER COPY - PERSONAL LICENSE

DO NOT CIRCULATE

CASE SUMMARY

The largest stone building on Earth has no body in it. It never did. Six million tons of stone, placed to a precision modern contractors cannot match, and the official explanation rests on one patch of red paint in a crawlspace no tourist will ever see.

This file collects what the record actually says. Not what the guidebooks say the record says. The measurements are from Flinders Petrie, the most respected surveyor ever to work the plateau. The excavation accounts are from the men who were there. The problems below are not fringe claims. They are sitting in the primary sources, unanswered since the file was opened.

The question of record: who sealed an empty granite box inside a mountain of stone, aligned it to true north within a twentieth of a degree, and left no tools, no plans, and no name.

The reader will also find, in this expanded filing, the explanations the plateau's gatekeepers refuse to test, the artifacts that were recovered from inside the monument and then lost by the institutions holding them, and the pattern of blocked excavation that has kept every major question open for nearly two centuries. None of it is speculation about what the evidence might be. All of it is documentation of where the evidence went.

TIMELINE OF RECORD

- | | |
|---------------------|--|
| c. 10,500 BC | Epoch flagged by the Orion correlation: the three Giza pyramids mirror the belt of Orion as it stood at this date, and the Sphinx faces the point where Leo rose at dawn. The official chronology has no builders alive to know this. The stones know it anyway. |
| c. 2560 BC | Assigned construction date. Derived from later king lists, not from anything found inside the structure. |
| c. 440 BC | Herodotus visits Giza. His guides tell him the pyramid took 100,000 men twenty years. He is writing two thousand years after the fact, as far from the builders as we are from the Roman Empire. |
| AD 820 | Caliph al-Mamun's crews tunnel in. The accounts describe sealed passages and an empty granite coffer. No mummy. No treasure. No inscriptions. |

- 1765 Nathaniel Davison finds the first relieving chamber above the King's Chamber. Bare stone. No markings recorded.
- 1837 Colonel Howard Vyse, out of money and out of time, blasts into four more relieving chambers with gunpowder. Red ochre quarry marks naming Khufu are reported in the new chambers. This paint becomes the single physical link between the king and the building. FILE OPENED.
- 1872 Waynman Dixon opens the Queen's Chamber shafts and recovers three objects from inside: a bronze hook, a granite ball, and a length of cedar. The cedar, the only datable object ever found in the shafts, is later lost by the institutions holding it for over a century.
- 1880-1882 Flinders Petrie surveys the plateau. His published figures on the casing stones and the coffer remain the baseline dataset. Several of his own remarks about machining are quietly dropped from later summaries.
- 1933 Edgar Cayce states in trance that a Hall of Records from a drowned civilization lies beneath the Sphinx, to be found near the millennium. The plateau authority spends the following decades refusing subsurface permits at exactly that location.
- 1987-1993 Seismic and resistivity surveys by separate teams report cavities under and around the Sphinx, including a rectangular void under the paws. Follow-up drilling is not permitted.
- 1991 Geologist Robert Schoch presents evidence that the Sphinx enclosure shows deep rainfall erosion, requiring a date thousands of years before Khufu, into a climate era with no pharaohs. The response of the field is not a rebuttal of the geology. It is the statement that there was no civilization then to build it. The stones are overruled by the timeline.
- 1993 The Upuaut-2 robot finds a small limestone door with two corroded metal pins at the top of the southern Queen's Chamber shaft. Metal, in a monument that officially predates the use of iron. Further exploration is halted for nine years.

- 2002** A drill camera pushes through the Gantenbrink door on live television and finds a second sealed block behind it. The broadcast ends. The follow-up never airs.
- 2017** The ScanPyramids muon survey confirms a void above the Grand Gallery at least thirty meters long. It is the largest discovery inside the pyramid since 1837. As of this filing it remains unentered.
- 2022** Radar specialist Filippo Biondi and Corrado Malanga publish a peer-reviewed synthetic aperture radar study in Remote Sensing, resolving undiscovered internal structure inside the Great Pyramid from satellite data. The method converts radar echoes into tomography. The paper passes review. The field does not follow up.
- 2025** Biondi and Malanga's Khafre Project announces the same method applied beneath the plateau: eight vertical cylindrical wells wrapped in spiral descending structures, reaching roughly 648 meters below the Khafre pyramid, feeding two massive cubic structures, with returns suggesting a far larger complex deeper still. The response arrives within days, without any counter-scan: the findings are declared impossible. No instrument is sent to check. FILE FLAGGED.

The Giza plateau from the southwest, photographed by Francis Frith around 1857, twenty years after Vyse's gunpowder entry and before modern restoration. The casing stones Petrie measured to half a millimeter are already stripped. What remains is the core: six million tons, placed by no one on record.

Source: Francis Frith, c. 1857. Public domain.

THE OFFICIAL STORY

The position of record is simple. The pyramid is a tomb. Khufu built it around 2560 BC over roughly twenty years, using copper tools, stone hammers, wooden sledges and ramps. The workforce was in the tens of thousands. The mummy was lost to tomb robbers at some unknown date.

Every part of that story is an inference. The date comes from king lists written centuries later. The method comes from experiments that moved single blocks a short distance on level ground. The tomb designation comes from the coffer, which was found empty, in a chamber with no funerary inscriptions of any kind. The robbery is assumed because the alternative is admitting the box was always empty.

Run the tomb theory against the rest of the plateau and it gets worse. Egypt's actual royal tombs are text from floor to ceiling: spells, titles, maps of the underworld, the king's name repeated hundreds of times. The pyramid assigned to the most powerful king of the age contains none of that. Zero ritual text. The official answer is that the tradition of inscribing tombs came later. So the story is that the Egyptians built their grandest tomb first, silent, perfect, and empty, and then spent two thousand years building smaller, cruder, chattier ones. Civilizations do not work in that direction. Decline works in that direction.

WHAT THE RECORD SHOWS

Start with the numbers, because the numbers are not disputed. The base covers thirteen acres and is level to within about two centimeters. The sides align to true north with an average error of three sixtieths of one degree. Petrie measured casing joints at half a millimeter, filled with cement, over faces of stone weighing sixteen tons. He wrote that the accuracy was equal to opticians' work on a scale of acres.

The granite came from Aswan, five hundred miles upriver. The coffer in the King's Chamber was cut from a single block of it. Petrie examined the saw and drill marks and concluded the cutting pressure ran to tonnes, with tools he could not identify. He called the drilling problem troublesome and left it there. His successors mostly stopped mentioning it. The drill cores themselves survive, including one in a London museum drawer, and the spiral groove on it cuts deeper through the hard quartz than the soft feldspar, which is backwards for every abrasion method the official toolkit contains. Engineers who examine it keep reaching the same verdict: the feed rate is wrong for copper and sand by an order of magnitude. The field's response has been to stop letting engineers examine it.

Now the paint. The entire attribution of this building to Khufu hangs on red ochre marks in chambers that were sealed until [REDACTED] way in with gunpowder in]] 1837. Vyse was deep in debt to his expedition's backers and had found nothing. Within weeks of reaching the sealed chambers he reported the only inscriptions ever found in the pyramid. The marks include forms of the royal name whose spelling matched the reference books available in 1837, including their errors. His own team's account records that the marks in the first chamber he opened were noticed only after he had been inside with paint and brushes in the camp inventory. That dispute has never been closed. It has only been declared closed.

The paint problem has a second layer. The Inventory Stela, found at Giza in 1858, states in carved stone that Khufu restored the Sphinx and built his pyramid beside monuments that already existed. The official position is that the stela is a late fabrication. Note the method: the artifact that supports the timeline, red paint found by a bankrupt colonel, is accepted without hesitation, and the artifact that breaks the timeline, a carved stone inventory, is ruled a forgery. The evidence is not being weighed. It is being sorted.

And the shafts. Two narrow channels rise from the Queen's Chamber, cut with precision through two hundred feet of masonry, leading nowhere a person could go. In 1993 a robot climbed the southern shaft and found a fitted limestone door with two metal pins. A drill camera later showed a small chamber and a second blocking stone behind it. The pins are metal. The official chronology says this monument was built a thousand years before Egypt worked iron. The find was announced, filmed, and then the file simply went quiet.

Cross-section of the internal system, after Petrie's survey. Note the five relieving chambers stacked above the King's Chamber, sealed from construction until 1837, and the shafts rising from both chambers through two hundred feet of coursed masonry. Every inscription ever reported from this monument comes from the sealed spaces at the top of this diagram.

UNSANCTIONED EXPLANATIONS

Strip away the tomb story and the building has to be something. This office records the standing theories, notes that each one explains evidence the official account cannot touch, and notes that not one of them has ever been put to the test on the plateau, because testing is exactly what the permits never allow.

THEORY ONE. THE MACHINE. Engineer Christopher Dunn spent decades analyzing the internal system as a technical drawing rather than a floor plan, and the drawing reads as a device. The King's Chamber is built of granite, which is quartz-bearing and piezoelectric, meaning it generates charge under stress, and the chamber sits under forty-three roof beams weighing up

to seventy tons whose measured cracking shows they took a violent internal event. Dunn's schematic is specific. The Queen's Chamber is the reaction vessel: chemicals fed down its two shafts combined to generate hydrogen, and the salt crusts early explorers found caked up to half an inch thick on its walls, crusts the tomb theory has never explained at all, are on this reading the residue of that reaction, exactly where residue should be. The Grand Gallery's corbelled profile is a resonator hall. The King's Chamber converts the Earth's seismic hum to power, and the hydrogen carries it out. And the file notes what the modern instruments add: elevated radon readings inside the monument serious enough that ventilation was installed for tourists, thermal anomalies on the eastern face flagged by the 2016 infrared survey, and granite in the King's Chamber that is scorched, expanded and fractured. The official file explains the radon as natural uranium, the cracking as an earthquake, and the salt as seepage, three separate accidents in one room. Dunn's reading needs one event. The machine is real, it is tuned to the Earth, and it did not retire. It failed, at reactor scale, and the King's Chamber is the damage report.

THEORY TWO. THE STAR MAP. Robert Bauval noticed what surveyors had stared past for a century: the three Giza pyramids are laid out as Orion's belt, correct relative sizes, correct offset of the third star, and the layout locks to the sky of roughly 10,500 BC, the same epoch the Sphinx, a lion, faced the constellation Leo at dawn, and the same epoch Schoch's rainfall erosion requires. Three independent lines of evidence converge on one date, and that date sits squarely in the era every flood tradition on Earth calls the destruction of a former world. The official chronology rejects the date not because the alignments fail but because accepting it means a civilization existed that the textbooks have to be rewritten around.

THEORY THREE. THE SURVIVORS. Put the erosion, the star clock and the machine-grade tolerances together and the theory writes itself: Giza is the work of a civilization destroyed at the end of the last ice age, whose survivors seeded Egypt, which is why Egypt appears in the record already complete, pyramids first, decline after. The Egyptians themselves said exactly this. Their king lists, the ones the official date is cherry-picked from, run tens of thousands of years deeper than the officially accepted portion, through dynasties of gods and the Shemsu Hor, the Followers of Horus, who ruled before the first human king. The field keeps the bottom of the list and discards the top of the same document. This office notes you do not get to date a building off a list you have declared mostly mythical.

THEORY FOUR. THE HALL OF RECORDS. Edgar Cayce, who was documented solving medical cases he had no means of knowing, stated that the records of the drowned civilization lie in a chamber beneath the Sphinx. Decades later, seismic surveys found a rectangular cavity under the paws, precisely where he pointed. The response was not excavation. The response was a permanent halt to subsurface work at the Sphinx, and the researchers who found the cavity lost their plateau access. The chamber has been located, on instruments, by credentialed teams, and it sits there today, unopened, behind a permit wall.

THEORY FIVE. THE KNOWLEDGE. The building encodes the size and shape of the Earth: its perimeter to height gives pi, its proportions give phi, its base length ties to the geographic degree, and it sits on the longest possible land-crossing parallel and meridian on the planet. Whoever built it had surveyed the entire globe. There are two ways to survey a globe: over millennia of coordinated science, or from above. The record supports either. The record supports nothing less.

THEORY SIX. THE CITY BELOW. In 2022, radar specialist Filippo Biondi and Corrado Malanga published a peer-reviewed study in the journal Remote Sensing using synthetic aperture radar tomography, converting satellite radar echoes and the pyramid's own micro-vibrations into images of its interior. The method resolved the known chambers correctly, which is the control every imaging technique is judged by, and it also resolved structure the official plans do not contain. In 2025 the same team turned the method on the ground beneath Khafre and announced eight vertical cylindrical wells wrapped in descending spiral structures, dropping roughly six hundred and forty-eight meters below the plateau into two enormous cubic structures, with returns suggesting the complex keeps going deeper than the scan. Set that against what the plateau's own record already whispers: Herodotus reporting underground chambers beneath Giza, the workmen's legends of a sealed city, the instrument-confirmed cavities of Items 7 and the Hall of Records tradition of Theory Four, all pointing down. The response to the 2025 announcement arrived within days: the findings were declared scientifically baseless by the same authority that controls all digging. No counter-scan was published. No borehole was sunk. The one test that would settle it, a drill to depth at the announced coordinates, is exactly the test that cannot be permitted, and this office notes that you do not forbid people from looking for something that is not there.

ANOMALIES ON FILE

ITEM 1. No mummy, no burial goods, no funerary inscription has ever been recovered from the Great Pyramid. Every other confirmed tomb of the period is covered in ritual text. The largest one has none.

ITEM 2. The building encodes its own geography. The ratio of its perimeter to its height gives pi to four digits. Its latitude matches the speed of light in meters per second to six digits, 29.9792 N. The official position is that both are coincidences. The file notes that the position requires two separate coincidences.

ITEM 3. The Descending Passage is cut straight through bedrock for a hundred meters with a mean deviation of about six millimeters. This was done, per the official account, by lamplight, with copper. No soot has ever been reported from the sealed sections.

ITEM 4. The relieving chambers were sealed to all access from the day of construction. The only inscriptions in the entire monument are in those chambers, found by a bankrupt colonel using gunpowder, and match the reference books of his own century.

ITEM 5. The Dixon relics, the only portable artifacts ever recovered from inside the shafts, were split between institutions and the one datable object, the cedar piece, vanished for over a century. When a fragment resurfaced in a museum cigar box in 2020, its radiocarbon range ran up to five centuries OLDER than Khufu. The official explanation is old wood. The file notes the only shaft artifact ever dated predates the official builder.

ITEM 6. The Gantenbrink door was found in 1993. The follow-up took nine years and ended on a cliffhanger in 2002 with a second sealed block. In the two decades since, the most publicized doorway in archaeology has simply not been opened. Whoever controls the schedule is in no hurry to learn what is behind it, or already knows.

ITEM 7. Cavities under the Sphinx were instrument-confirmed by two independent teams by 1993. Drilling was refused, the teams' permits were terminated, and the plateau authority's public line moved from nothing is there to whatever is there is natural. Instruments do not detect natural rectangles.

ITEM 8. A thirty meter void confirmed by three independent muon teams in 2017 sits above the Grand Gallery. Eight years later there is no published plan to enter it. The most significant internal discovery in two centuries is being left alone, by the same authority that left Items 5 through 7 alone.

ITEM 9. The King's Chamber holds three unexplained physical facts in one room: granite roof beams cracked and displaced by a violent event the tomb theory cannot name, walls and beams showing heat effects, and radon levels high enough to require forced ventilation. Each fact has a separate official explanation. No official explanation covers all three.

ITEM 10. The 2025 subsurface radar findings under Khafre, from a team with a peer-reviewed publication record on this exact monument, were declared impossible within days of announcement. No competing scan of the same coordinates has been published before or since. The refutation contains no data. It contains only rank.

The Grand Gallery, plate from Piazzi Smyth's 1877 survey volume. A corbelled hall eight meters high and forty-seven meters long, machined through the body of the pyramid at a 26 degree climb. It leads to a chamber holding one empty box. The 2017 muon survey found a second void of comparable length directly above this space. It has never been entered.

THE GATEKEEPING PATTERN

Every unresolved item in this file shares one feature: the follow-up was stopped by administration, not by evidence. The Sphinx cavity teams lost their permits. The shaft robot program stalled for nine years between discovery and inspection, then went dark after finding a second door. The muon void has waited eight years without a borescope. The drill core sits in a drawer. The cedar sat in a cigar box for a hundred and fifty years. And in 2025 the pattern ran in public, in real time: a radar team with a peer-reviewed method announced structures half a kilometer under Khafre, and the plateau's gatekeepers issued their verdict inside a week, without pointing a single instrument at the ground.

For most of the modern era, access to the plateau's open questions has run through a single administrative choke point, and the men who have held it have been explicit that certain theories will not be dignified with testing. Excavation requests aimed at the Sphinx subsurface, the void, or the door are not denied on safety grounds. They are denied on the grounds that there is nothing to find. That is not an archaeological statement. That is a [REDACTED], enforced by permit.

This office does not need to guess what is being protected to observe that something is. Institutions do not spend forty years not looking in four specific places by accident. The pattern of refusal is itself data, and it points, every time, at the same question: what is inside this monument, and who decided the public would not find out.

FINAL ASSESSMENT

The tomb theory survives because it was written down first, not because the evidence supports it. An empty, uninscribed box is not a burial. Paint found by a desperate man is not a signature. A sealed door with metal pins is not a decoration. A carbon date older than the king is not old wood.

The measured facts describe a machine-grade structure erected by builders whose methods left no trace and whose purpose was never written down, at a precision the official toolkit cannot reproduce. Someone knew the exact size of the Earth, the location of true north, and how to cut granite like wood, and the convergent dating from the geology and the star map puts someone on the plateau thousands of years before the first pharaoh. The record does not say who. The record says only that it happened, and that every instrument pointed at the remaining chambers has been switched off by the same hands.

This office assesses the Great Pyramid as a purpose-built instrument of unknown function, misfiled as a tomb for seven centuries of scholarship, standing inside an active perimeter of administrative denial. The void above the Grand Gallery, the chamber behind the Gantenbrink door, the rectangle under the Sphinx, and the wells beneath Khafre are the four places the story breaks open. All four are located, on instruments, by named researchers. All four are sealed by policy, not by stone. The case stays open until one of them is entered on camera, in public, with the feed left running.
